

Viruses can enter a computer system in a number of ways, including:

- E-mails or e-mail attachments
- Internet downloads
- Visiting unknown web pages
- Installing unknown software releases from disc or CD

To protect against viruses every user should:

- Use anti-virus software to remove or isolate viruses.
- Update anti-virus regularly to detect new viruses.

Other types of malware include items such as worms, Trojan horses and spyware.

If you have any concerns about viruses or malware please contact us at Computer Universe and we can assist you in updating your system.
